

#### General

#### Title

Central venous catheter-related bloodstream infections (area-level): rate per 100,000 population.

#### Source(s)

AHRQ quality indicators. Guide to patient safety indicators [version 3.1]. Rockville (MD): Agency for Healthcare Research and Quality (AHRQ); 2007 Mar 12. 76 p. (AHRQ Pub; no. 03-R203).

AHRQ quality indicators. Patient safety indicators: technical specifications [version 4.1]. PSI #23 central venous catheter-related bloodstream infections (area-level indicator). Rockville (MD): Agency for Healthcare Research and Quality (AHRQ); 2009 Dec 1. 1 p.

#### Measure Domain

## Primary Measure Domain

Population Health

The validity of measures depends on how they are built. By examining the key building blocks of a measure, you can assess its validity for your purpose. For more information, visit the Measure Validity page.

## Secondary Measure Domain

Does not apply to this measure

## **Brief Abstract**

## Description

This measure is used to assess the number of cases of selected infections defined by specific International Classification of Diseases, Ninth Revision, Clinical Modification (ICD-9-CM) codes (999.3 or 996.62 for discharges prior to October 1, 2007 and 999.31 for discharges on or after October 1, 2007) per 100,000 population.

#### Rationale

Hospitals in the United States provide the setting for some of life's most pivotal events - the birth of a child, major surgery, treatment for otherwise fatal illnesses. These hospitals house the most sophisticated medical technology in the world and provide state-of-the-art diagnostic and therapeutic services. But access to these services comes with certain costs. About 30% of personal health care expenditures in the United States go towards hospital care, and the rate of growth in spending for hospital services has only recently leveled out after several years of increases following a half a decade of declining growth. Simultaneously, concerns about the quality of health care services have reached a crescendo with the Institute of Medicine's series of reports describing the problem of medical errors and the need for a complete restructuring of the health care system to improve the quality of care. Policymakers, employers, and consumers have made the quality of care in U.S. hospitals a top priority and have voiced the need to assess, monitor, track, and improve the quality of inpatient care.

Widespread consensus exists that health care organizations can reduce patient injuries by improving the environment for safety from implementing technical changes, such as electronic medical record systems, to improving staff awareness of patient safety risks. Clinical process interventions also have strong evidence for reducing the risk of adverse events related to a patient's exposure to hospital care. Patient Safety Indicators (PSIs), which are based on computerized hospital discharge abstracts from the AHRQ's Healthcare Cost and Utilization Project (HCUP), can be used to better prioritize and evaluate local and national initiatives. Analyses of these and similar inexpensive, readily available administrative data sets may provide a screen for potential medical errors and a method for monitoring trends over time.

The Central Venous Catheter-related Blood Stream Infections indicator is intended to flag cases of infection due to medical care, primarily those related to intravenous (IV) lines and catheters. This indicator is defined both on a provider level (by including cases based on a secondary diagnosis associated with the same hospitalization) and on an area level (by including all cases of such infection) (see the related National Quality Measures Clearinghouse [NQMC] summary of the Agency for Healthcare Research and Quality [AHRQ] indicator Central venous catheter-related blood stream infections (provider-level): rate per 1,000 discharges). Patients with potentially immunocompromised states (e.g., AIDS, cancer, transplant) are excluded, as they may be more susceptible to such infection.

## Primary Clinical Component

Intravenous (IV) lines and catheters; infection

## **Denominator Description**

Population of county or Metro Area associated with Federal Information Processing Standards (FIPS) code of patient's residence or hospital location

## **Numerator Description**

Discharges, 18 years and older or Major Diagnostic Category (MDC) 14 (pregnancy, childbirth, and puerperium), with selected infections defined by specific International Classification of Diseases, Ninth Revision, Clinical Modification (ICD-9-CM) codes (999.3 or 996.62 for discharges prior to October 1, 2007 and 999.31 for discharges on or after October 1, 2007) in any diagnosis field among all medical and surgical discharges defined by specific Diagnosis-Related Groups (DRGs) or Medicare Severity DRGs

#### Exclude cases:

With any diagnosis or procedure code for immunocompromised state With any diagnosis of cancer

 $Note: Refer to the Technical Specifications document for specific ICD-9-CM codes, DRGs \ and \ MS-DRGs.$ 

## Evidence Supporting the Measure

## Evidence Supporting the Value of Monitoring the Aspect of Population Health

A formal consensus procedure involving experts in relevant clinical, methodological, and organizational sciences

One or more research studies published in a National Library of Medicine (NLM) indexed, peer-reviewed journal

## Evidence Supporting Need for the Measure

#### Need for the Measure

Monitoring health state(s)

Variation in health state(s)

#### Evidence Supporting Need for the Measure

AHRQ quality indicators. Guide to patient safety indicators [version 3.1]. Rockville (MD): Agency for Healthcare Research and Quality (AHRQ); 2007 Mar 12. 76 p. (AHRQ Pub; no. 03-R203).

## State of Use of the Measure

#### State of Use

Current routine use

#### Current Use

Federal health policymaking

Monitoring health state(s)

State health policymaking

## Application of Measure in its Current Use

## Care Setting

Unspecified

## Professionals Responsible for Health Care

Nurses

Public Health Professionals

## Lowest Level of Health Care Delivery Addressed

Counties or Cities

#### **Target Population Age**

- Age greater than or equal to 18 years
- Any age in Major Diagnostic Category (MDC) 14 (pregnancy, childbirth, and puerperium)

#### **Target Population Gender**

Either male or female

#### Stratification by Vulnerable Populations

Unspecified

## Characteristics of the Primary Clinical Component

#### Incidence/Prevalence

Unspecified

## Association with Vulnerable Populations

Unspecified

#### Burden of Illness

Unspecified

#### Utilization

Unspecified

#### Costs

Unspecified

# Institute of Medicine (IOM) Healthcare Quality Report Categories

#### **IOM Care Need**

Getting Better

#### **IOM Domain**

Safety

#### Data Collection for the Measure

#### Case Finding

Both users and nonusers of care

#### Description of Case Finding

Population of county or Metro Area associated with Federal Information Processing Standards (FIPS) code of patient's residence or hospital location

#### **Denominator Sampling Frame**

Geographically defined

#### **Denominator Inclusions/Exclusions**

Inclusions

Population of county or Metro Area associated with Federal Information Processing Standards (FIPS) code of patient's residence or hospital location

Exclusions

Unspecified

## Relationship of Denominator to Numerator

All cases in the denominator are not equally eligible to appear in the numerator

## Denominator (Index) Event

Patient Characteristic

#### **Denominator Time Window**

Time window is a single point in time

## Numerator Inclusions/Exclusions

Inclusions

Discharges, 18 years and older or Major Diagnostic Category (MDC) 14 (pregnancy, childbirth, and

puerperium), with selected infections defined by specific International Classification of Diseases, Ninth Revision, Clinical Modification (ICD-9-CM) codes (999.3 or 996.62 for discharges prior to October 1, 2007 and 999.31 for discharges on or after October 1, 2007) in any diagnosis field among all medical and surgical discharges defined by specific Diagnosis-Related Groups (DRGs) or Medicare Severity DRGs

Exclusions

Exclude cases:

With any diagnosis or procedure code for immunocompromised state With any diagnosis of cancer

Note: Refer to the Technical Specifications document for specific ICD-9-CM codes, DRGs and MS-DRGs.

## Measure Results Under Control of Health Care Professionals, Organizations and/or Policymakers

The measure results are somewhat or substantially under the control of the health care professionals, organizations and/or policymakers to whom the measure applies.

#### Numerator Time Window

Unspecified

#### **Data Source**

Administrative data

National public health data

## Level of Determination of Quality

Does not apply to this measure

## Type of Health State

Adverse Health State

## Pre-existing Instrument Used

Unspecified

## Computation of the Measure

## Scoring

Rate

## Interpretation of Score

A lower score is desirable

#### Allowance for Patient Factors

Unspecified

#### Standard of Comparison

External comparison at a point in time

External comparison of time trends

Internal time comparison

## **Evaluation of Measure Properties**

#### **Extent of Measure Testing**

The Patient Safety Indicators (PSIs) were evaluated by the project team using empirical analyses to explore the frequency and variation of the indicators, the potential bias, based on limited risk adjustment, and the relationship between indicators. The data sources used in the empirical analyses were the 1997 Florida State Inpatient Database (SID) for initial testing and development and the 1997 Healthcare Cost and Utilization Project (HCUP) State Inpatient Database for 19 States for the final empirical analyses.

All potential indicators were examined empirically by developing and conducting statistical tests for precision, bias, and relatedness of indicators. Three different estimates of hospital performance were calculated for each indicator:

The raw indicator rate was calculated using the number of adverse events in the numerator divided by the number of discharges in the population at risk by hospital.

The raw indicator was adjusted to account for differences among hospitals in age, gender, modified Diagnosis-Related Group (DRG), and comorbidities.

Multivariate signal extraction methods were applied to adjust for reliability by estimating the amount of "noise" (i.e., variation due to random error) relative to the amount of "signal" (i.e., systematic variation in hospital performance or reliability) for each indicator.

The project team constructed a set of statistical tests to examine the precision, bias, and relatedness of indicators for all accepted Provider-level Indicators, and precision and bias for all accepted Area-level Indicators. It should be noted that rates based on fewer than 30 cases in the numerator or the denominator are not reported.

The project team conducted a structured review of each indicator to evaluate the face validity (from a clinical perspective) of the indicators. The methodology for the structured review was adapted from the RAND/UCLA Appropriateness Method and consisted of an initial independent assessment of each indicator by clinician panelists using an initial questionnaire, a conference call among all panelists, followed by a final independent assessment by clinician panelists using the same questionnaire. The review sought to establish consensual validity, which "extends face validity from one expert to a panel of experts who examine and rate the appropriateness of each item..." The panel process served to refine definitions of some indicators, add new measures, and dismiss indicators with major concerns from further consideration.

Refer to the original measure documentation for additional details.

## Evidence for Reliability/Validity Testing

AHRQ quality indicators. Guide to patient safety indicators [version 3.1]. Rockville (MD): Agency for Healthcare Research and Quality (AHRQ); 2007 Mar 12. 76 p. (AHRQ Pub; no. 03-R203).

## **Identifying Information**

#### **Original Title**

Central venous catheter-related bloodstream infections (area-level indicator) (PSI 23).

#### Measure Collection Name

Agency for Healthcare Research and Quality (AHRQ) Quality Indicators

#### Measure Set Name

Patient Safety Indicators

#### Submitter

Agency for Healthcare Research and Quality - Federal Government Agency [U.S.]

#### Developer

Agency for Healthcare Research and Quality - Federal Government Agency [U.S.]

## Funding Source(s)

Agency for Healthcare Research and Quality (AHRQ)

## Composition of the Group that Developed the Measure

The Agency for Healthcare Research and Quality (AHRQ) Quality Indicators are in the public domain and the specifications come from multiple sources, including the published and unpublished literature, users, researchers, and other organizations. AHRQ as an agency is responsible for the content of the indicators.

## Financial Disclosures/Other Potential Conflicts of Interest

None

## Adaptation

This indicator was originally proposed by Iezzoni and colleagues (1994) as part of the Complications Screening Program (CSP) (CSP 11, "miscellaneous complications"). The University HealthSystem Consortium adopted the CSP indicator for major (#2933) and minor (#2961) surgery patients. A much narrower definition, including only 9993 ("other infection after infusion, injection, transfusion, vaccination") was proposed by Miller and colleagues (2001) in the "Patient Safety Indicator Algorithms and Groupings." The American Nurses Association (1999) and its State associations have identified the

number of laboratory-confirmed bacteremic episodes associated with central lines per critical care patient day as a "nursing-sensitive quality indicator for acute care settings."

#### **NQMC Status**

This NQMC summary was completed by ECRI on October 1, 2003. The information was verified by the measure developer on October 29, 2003. This summary was updated by ECRI on February 7, 2005. The information was verified by the measure developer on April 25, 2005. This NQMC summary was updated again on February 9, 2006 and again on June 13, 2006. The information was verified by the measure developer on July 31, 2006. This NQMC summary was updated by ECRI Institute on June 12, 2007, November 10, 2008 and again on June 21, 2010.
